Eliminating ADPICS Transaction Abend on R*STARS 37 Screen

A change was made, last night 12/03/98, to the production system so that users will no longer encounter an abend (-803) when posting an ADPICS transaction to the R*STARS 37 Screen.

One of the data elements displayed on the R*STARS 37 Screen is the time at which the transaction was posted. Because transactions were being processed more quickly by the system (more than one transaction per document in less than 1/100th of a second), users were encountering abends with a greater frequency. Since the "time posted" was not unique for each transaction in these instances, the system generated a "duplicate" error message and created a transaction abend.

The system was changed to allow concurrent posting "time" for more than one transaction per document on the R*STARS 37 Screen. As a result of this change, the sequence in which action codes appear on the R*STARS 37 Screen may be different than before the change. For example, if the action code 100 and 123 occur in the same "1/100th of a second," the action code 123 may be displayed as preceding the action code 100. Prior to the change, the action code 100 would have been displayed first. This is only a screen display issue.
